

1. What is Microsoft Access database?

Microsoft Access database is a relational database management system which combines GUI (Graphical User Interface) with Microsoft Jet database engine. It can import and use data from Access, SQL, Oracle, etc.

2. What is the way to link the explicit data into Access database?

Follow the instructions given below to link explicit data into Access database:

- Go to main menu and click on EXTERNAL DATA within Import and Link group.
- Import the required file.
- Follow the instruction in the Get External Data wizard to know about the file that can link Access database.

3. What are the various type of relations between different data?

The data within the table can build only three types of relationships:

- **One-to-one relationship:** This relationship specifies that only one item of table can link to one item of another table.
- **One-to-many relationship:** This relationship specifies that one item of a table can corresponds to more than one item of another table.
- **Many-to-many relationship:** This relationship specifies that more than one item of a table can corresponds to more than one item of another table
-
